

Copying Modules from one site to another

From time to time, you want to copy a module in the `src/Juicebox/Modules` folder that was made for another website. To make this an easier process for the next poor soul who thought they had to recreate all the module fields in ACF - here is a way to get around that.

Copy the module

Copy the entire module from the source website. Eg.

And paste the module to the destination website.

Edit "Modules" ACF json file modified variable

Edit the `modified` field in Modules ACF json file ie. `<theme>/acf-json/group_588574a592c85.json` to be a higher number than the current.

- Note: some sites have a different group ID, so make sure you copy the `group_<key>` for the next step.

```

{
  "key": "group_588574a592c85",
  "title": "Modules",
  "fields": [
    {
      "key": "field_588574a91201e",
      "label": "Modules",
      "name": "modules",
      "type": "flexible_content",
      "instructions": ""
    }
  ]
}

```

Check/edit the specific modules fields.json field

Edit the `fields.json` in your module that was copied across and make sure the `group` key in this file matches the group in your modules ACF. eg. `group_588574a592c85`

Sync "Modules" field group in admin

Then log in to your WP backend, and go to Custom Fields

- You should now see a sync available link

| [Sync available \(1\)](#) |

- Go to the link and sync the Modules field group. Once complete - you should now see the module in the group 😊
