

Laravel Mix & webpack

Laravel Mix is a tool that provides a simple, fluent API for defining basic webpack build steps on Juicebox WordPress websites. It simplifies the configuration process and enables you to easily set up and manage a website's assets, such as CSS and JavaScript files, without needing extensive knowledge of webpack. Laravel Mix comes with built-in support for several common CSS and JavaScript pre-processors. At Juicebox we primarily use SASS.

In-depth knowledge of webpack or Laravel Mix is not necessary for working on Juicebox websites, however, If you would like to learn more about Laravel Mix and how it is used as a wrapper for webpack, additional information can be found on the laravel-mix/docs repository on GitHub. The documentation provides in-depth instructions on how to use Laravel Mix and integrate it into your project, as well as examples and best practices for configuring webpack build steps.
